Windows 11: Install Python and Google Antigravity

Use this guide to remove old Python installations first, then install a fresh copy of Python and Google Antigravity.

1. Remove all existing Python installations

1. Close Command Prompt, Python, and any IDEs.
2. Press `Win + R`, type `control`, and press Enter to open **Control Panel**.
3. Select **Programs** > **Programs and Features**.
4. Find every entry whose name starts with **Python** (for example, Python 3.x, Python Launcher, or Python Documentation).
5. Select each Python-related entry and choose **Uninstall**. Complete every uninstaller.

2. Remove Python from Microsoft Store

1. Open **Microsoft Store**.
2. Select **Library** in the lower-left corner.
3. Search for **Python**.
4. Uninstall every installed Python app or version.

3. Restart Windows

1. Restart the computer: **Start** > **Power** > **Restart**.

4. Confirm that Python is no longer available

1. After Windows restarts, open **Command Prompt**: press `Win + R`, type `cmd`, and press Enter.
2. Run these commands:

```
python --version
python3 --version
```

3. If both commands report that they are not recognized, continue to the installation steps.

4. If Windows opens Microsoft Store instead, turn off the `python.exe` and `python3.exe` entries in **Settings** > **Apps** > **Advanced app settings** > **App execution aliases**, then open a new Command Prompt and repeat the check.
5. If either command still shows a version, remove the remaining Python installation before continuing.

5. Install Python

1. Go to the official Python download page: https://www.python.org/downloads/windows/.
2. Download the latest stable **Python 3** Windows installer (normally **Windows installer (64-bit)**).
3. Run the downloaded installer.
4. On the first installer screen, **select `Add python.exe to PATH`**.
5. Select **Install Now** and allow the installation to finish.
6. If Windows asks for permission, select **Yes**.

6. Verify Python and pip

1. Close Command Prompt and open a **new** Command Prompt window.
2. Run:

```
python --version
python -m pip --version
pip --version
```

3. Confirm that each command displays a Python or pip version. If `pip --version` does not work but `python -m pip --version` does, close and reopen Command Prompt once more. If necessary, rerun the Python installer and ensure the PATH option is selected.

7. Install Google Antigravity

1. Go to the official Google Antigravity download page: https://antigravity.google/download.
2. In the **Antigravity IDE** section, choose the Windows installer matching your computer:
   - Choose **x64** for most Windows 11 PCs.
   - Choose **ARM64** only for a Windows-on-ARM device.
3. Run the downloaded `.exe` file.
4. Follow the installation wizard and complete the setup.
5. Start **Google Antigravity** from the Start menu.
6. Sign in with the Google account you will use for Antigravity, if prompted.

8. Final check

Open Command Prompt and run:

```
python --version
pip --version
```

Both commands should display version information. Open Google Antigravity once to confirm that it launches successfully.
